

Instruction Manual

11" x 60" Scalperator

Style CMP2P

Manual Number 478

CARTER DAY
Carter Day International, Inc.
500 73rd Avenue N.E., Minneapolis, MN 55432
Phone: (763) 571-1000 * Fax: (763) 571-3012

**READ AND FOLLOW THE GUIDELINES ESTABLISHED WITHIN THIS
MANUAL TO ENSURE WARRANTY COVERAGE AND YEARS OF LOW-
COST OPERATION.**

***** WARNING *****

INTERNAL MOVING PARTS CAN BE DANGEROUS.

**BEFORE ATTEMPTING SERVICE OR INTERNAL INSPECTION,
DISCONNECT AND LOCKOUT ELECTRIC POWER.**

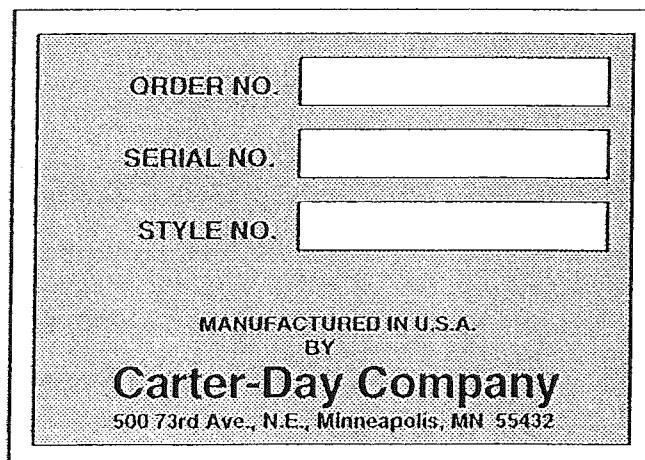

**DO NOT OPERATE THIS EQUIPMENT WITHOUT REQUIRED
SAFETY GUARDS OR COVERS IN PLACE.**

KEEP HANDS CLEAR OF INLETS AND OUTLETS.

CARTER DAY

IMPORTANT

Shown below is an example of a nameplate from a Carter Day machine. Please locate the nameplate on your machine and fill in the Order No., Serial No., and Style No. from it onto the nameplate on this page, for future reference. Having this information at hand when you call us for parts or service will be helpful.

Carter Day International, Inc.

Machinery Storage Requirements

Machinery should be placed into service as soon as possible after delivery.

If storage is required Carter Day recommends the following storage guidelines for its finished products.

While in storage machinery should be protected from corrosion and contamination.

The storage area temperature should be maintained between 0 degrees C (32 degrees F) and 40 degrees C(104 degrees F), temperature fluctuations should be limited to no more than 5 degrees C per 24 hour period.

The relative humidity should be maintained below 60%.

The storage area should be kept free from airborne contaminants such as, but not limited to: dust, dirt, harmful vapors, etc.

The storage area should be isolated from undue vibration.

Extreme conditions of any kind should be avoided.

If storage exceeds one month, shafts should be rotated monthly to insure proper lubrication of the bearings.

Failure to follow these guidelines may result in reduced product performance and component life. Equipment failure attributable to corrosion or contamination will not be covered by warranty. For example corrosion will cause shaft bearing failures, typically indicated by high bearing temperatures.

PRE-INSTALLATION CHECK

Be certain to check equipment as soon as it arrives. A quick visual inspection will generally show any damage which may have occurred during transit from the factory. Once this inspection is complete, ensure that all shipping blocks and packing materials are removed!

The section of this manual dealing with installation should be read carefully to ensure that any items shipped loose or wired to the equipment are assembled before proceeding! If the unit was shipped with motors - now would also be a good time to check voltages. All equipment is test run for a short period before leaving the factory - however a rough and/or long transport can loosen bolts. Check all bolts visually and also with proper tools where this is practical. Pay particular attention to auxiliary items which may be bolted to the machine proper. These could include drive bases, screw conveyors, spouts, ladders, platforms etc.

All machinery leaves the factory suitably protected from the elements. These protective measures have been designed to accommodate a normal ship and installation schedule. If the equipment will be subjected to weather for more than a few days before installation - special arrangements should be made to keep it dry. An accumulation of moisture on sensitive parts could lead to premature failure and unnecessary maintenance costs.

INSTALLATION

Depending on application and particular model, the scalperator is mounted directly to the top deck of the machine proper or to a support frame supplied. In either case, it is important that the machine be solidly mounted to ensure proper operation. It must be level and/or plumb to ensure that all moving parts are in correct alignment.

When the machine is mounted, be certain that the discharge is properly aligned with the inlet of the machine proper. This is necessary to ensure free flow of material as well as dust free operation.

FEED SPOUT NOTE

The feed to the scalperator inlet hopper should be as close to centre and as near a vertical drop as possible. Feeding at an angle or to one side may result in an uneven distribution of material to the scalping reel and subsequent poor scalping and aspiration performance.

If the unit was shipped without motors - these can now be installed. Always ensure that belts and/or chains are in proper alignment and tension. Arrows indicate proper rotation of various parts and wiring should be done to suit. If no rotational arrow can be found - call the factory or your representative for information.

TEST RUN

Before connecting feed and discharge spouting all motors should be turned on and the equipment should be run dry for a minimum of 10 - 15 minutes. Once the machine is processing material noise levels will be much greater and minor mechanical problems may go unnoticed.

Specifically, check the following:

- All motors should be rotating in the proper direction
- Motor running amps should be checked against name plate.
- Belts and chains should be tight and in alignment.
- The scalping reel should be rotating at 18 RPM.
- If the machine is equipped with a feed gate only, it should be checked for feed travel in its' guides.
- If so equipped check scalper fan(s) for proper rotation and RPM as per installation print. If more than a slight vibration is felt on housing(s) or shaft, consult the factory immediately.
- Ensure that air liftings discharge screw door swings freely and does not bind.

All bearings and/or gearboxes have been pre-serviced at the factory. See maintenance section for further lubrication instruction and schedules.

*** ANY GUARDS REMOVED TO INSTALL MOTORS / DRIVES ETC. MUST BE IN PLACE AT ALL TIMES WHEN EQUIPMENT IS OPERATING.

OPERATION

SPOUTING

The scalperator will operate most efficiently if a good head of material is maintained in the feed hopper. Most models have view ports so that the amount of material in the hopper is visible at all times.

See installation section of this manual: Feed Spout Note

There will be 4 types of material discharged from the machine. Each should be spouted according to system requirements.

- Clean grain will drop directly out of the main bottom discharge and into processing equipment below.
- Heavier air liftings from the expansion chamber discharged out the side of the machine by a screw conveyor.
- Scalpings or roughage are carried over the scalping reel and fall into a collecting hopper. A box or sack can be used here since normally this is not a large volume of material.
- Light dust passes thru the air discharge and to a dust collection system. See the installation print for machine air requirements and size the system accordingly.

NOTE FANLESS MODELS

If the machine is a fanless model - it is recommended that a blast gate or throttling device be installed near the air outlet of the machine. This is necessary to adjust the amount of air being pulled thru the scalperator. In any case the maximum amount of air provided to the machine should not exceed the requirement as per the installation print.

OPERATION CONTINUED

FEED ADJUSTMENT - GATE TYPE

On models equipped with a rack and pinion style feed gate, simply increase the opening until the desired rate of feed to the scalping reel is maintained. The volume will be determined by particular system requirements or until the scalping reel is flooded and begins to discharge good product along with the straws and trash over the reel.

On some low volume applications where the gate is open less than 1" - 1-1/2" it will be necessary to periodically check for bridging at the gate. An uneven distribution of feed to the scalping reel will result in poor product aspiration.

FEED ADJUSTMENT - ROLL TYPE

On this type of feeder, volume can be controlled in a number of ways. It can be adjusted by increasing or decreasing the gap between the roll itself and the wrap plate. Resetting of the stop screws on each side of the machine is all that is required.

The tension of the wrap plate against the roll will also control product flow. This is set by increasing or decreasing the spring force and resetting of the counterweights.

A little experimentation with the various adjustments will quickly give the proper relationship between wrap plate gap and tension. Be certain to adjust both sides equally or uneven feed may result across the width of the roll. In addition, on fragile product, maintain minimum necessary tension of the wrap plate to reduce product damage.

On models equipped with a variable speed feed roll, the volume can be adjusted by controlling the RPM. Most models equipped in this manner are capable of speeds ranging from 1 - 20 RPM.

SCALPING ADJUSTMENT

Most models are equipped with an adjustable plate behind the scalping reel. This "Grain Line" setting should be adjusted according to the feed rate. The material being processed should be allowed to build up high enough on the scalping reel to allow roughage and trash to be carried over.

Typically, at the high feed rates the plate should be in the lower setting or, the lower the feed rate - the higher the plate setting.

OPERATION CONTINUED

ASPIRATION ADJUSTMENT

Suction in the aspiration column is adjusted by means of an air bypass valve on the top deck of the machine. Maximum air is available when this gate is fully closed.

A simple method of setting is to adjust the gate until a small amount of good product is being discharged from the liftings screw and then reduce air by opening the bypass valve slightly.

On some applications it may be desirable to lift the odd good kernel to ensure the most complete aspiration possible.

CLEANOUT

The "Grain Line" plate behind the scalping reel will accumulate stones and various other trash over a period of time. A quick jerk on the adjustment lever while the machine is running will force the material over the reel and out.

On models equipped with a feed roll under the scalping reel a quick opening cleanout door is provided and should be checked periodically.

The air liftings conveyor is also generally supplied with a door of this type.

FACTORY TESTING SERVICE

In the event of a problem on a particular separation, contact the factory and submit a 5 lbs. sample of the material. A laboratory test will be run to duplicate the operation of the machine. An analysis of results and a recommendation will then be made.

MAINTENANCE / LUBRICATION

BEARINGS

There are two types of bearings used on this equipment. The sealed variety requires no maintenance and cannot be greased. The other style, usually found on fan and conveyor shafts, is indicated by a grease fitting on the bearing flange. The number and location of each type varies from one model to another.

The greaseable type should be serviced every 500 hours of operation. Use good quality 220 SUS viscosity grease.

The following or their equivalents are recommended:

CHEVRON SRI - 2

SHELL ALANIA - #2

ESSO UNITOL

CHAINS

These should be checked approximately every 500 hours along with the bearings. Tension and alignment should be checked and adjusted as required. A small amount of light motor oil should be applied.

Improper tension and/or alignment will cause premature wear or breakage and may also damage sprockets.

FRICITION CLUTCH

This assembly drives the scalping reel and provides protection in the event of a major blockage at the reel. It should be checked periodically by the operator and the clutch band tightened if slippage is evident. DO NOT OVER TIGHTEN ! A pull of approximately 90# should be necessary to cause the inner drum to slip.

MAINTENANCE / LUBRICATION CONTINUED

GEARBOX

Units are filled at the factory and should be checked periodically for leaking seals.

The factory fill meets requirements for operation in the -20 degrees F to +90 degrees F range and should be suitable for most applications.

After the initial break in period of 90 days - change intervals should be once a year.

Consult the factory for recommendations in severe applications.

The following or their equivalents are recommended:

ESSO SPARTAN ALL SEASON

MOBIL 66W SUPER CYLINDER OIL

STANDARD CHEVRON CMPD 140

TO ORDER PARTS

The appendix of this manual includes an indented parts list. This list, together with various drawings also included, makes it possible to identify the various components of the machine. When ordering parts, have the manual handy and try to identify the piece required by number and description.

Since equipment is constantly being updated and improved, the MODEL, STYLE and SERIAL NUMBER should also be quoted. This information is usually found on the front sheet. If for some reason the manual is not available, the information is also found on the metal tag affixed to the machine.

All of the above data is essential if parts are to be supplied quickly and correctly.

The following information would also be helpful when inquiring about a particular machine:

- A) JOB NUMBER
- B) APPROXIMATE SHIPPING DATE
- C) APPROXIMATE RUNNING TIME
